

Interplanetary Security Doctrine: Jurisdictional & Procedural Frameworks

Abstract: This document synthesizes the preceding research on the collapse of territorial sovereignty in multi-planetary legal systems. It integrates models of "Interplanetary Comity of Sovereignty" (ICS), the "Physical Verification Protocol" (PVP), and "Synchronized Truth Verification" (STV) to provide a comprehensive doctrine for managing security in contested jurisdictional environments.

I. The Jurisprudential Void

As human civilization expands into multi-planetary commerce, the reliance on static territorial sovereignty fails to address complex, multi-jurisdictional crime. The interaction between conflicting planetary laws and treaty obligations creates "legal dead zones" that facilitate criminal activity.

II. Operational Security Frameworks

A. The Verification Crisis & PVP

Organizations must adopt the **Physical Verification Protocol (PVP)**. Digital data (the "List") often contradicts physical reality, necessitating a *Baseline Reality Check* before any security asset is deployed. Failure to do so renders security forces complicit in "phantom property" management.

B. Mitigating Contractual SWATing

The "well-meaning" response is a vulnerability. Security firms must implement **Adversarial Compliance Monitoring (ACM)**. This involves rigorous Provenance Audits and independent triangulation of deployment mandates to prevent malicious actors from using security personnel as agents of criminal intrusion.

C. Synchronized Truth Verification (STV)

In contested planetary sovereignty, the **STV Protocol** acts as the primary defense against sovereignty-entrapment. By routing all protection mandates through a neutral third-party clearinghouse, planetary powers can avoid the "Sovereignty-Entrapment" loop where multiple forces collide at a single, manipulated coordinate.

Master Procedure: Multi-Jurisdictional Conflict Resolution

1. **Data Integrity Audit:** Extract metadata, cross-reference with historical archives, and perform a Baseline Reality Check.
2. **Sovereignty Triangulation:** Identify all claimant entities and verify treaty obligations in the specific site/context.
3. **Arbitration Initiation:** If conflicts or "Sovereignty-Entrapment" patterns (rapid/multiple registrations) are detected, trigger a hold on all deployment.
4. **Joint Verification:** Utilize the STV/Joint Arbitration panel to validate the legitimacy of the request.
5. **Responsive Action:** Deploy only upon confirmation of site physical state and verified jurisdictional authorization.
