

Higher dimensional aspects of a point in 9 dimensions of spatial complexity would differ from those applicable to one with different dimensional aspects in the same amount of spatial complexity (9 dimensions, as an illustration).

So if any technological effects that were calibrated for a point in space-time relied on higher dimensions to be properly calibrated, misunderstanding a point to be in one instance of the universe, or brane, rather than another, would lead to those effects being miscalibrated in higher dimensions, due to the higher dimensional differences between universes or branes.

Multiple effects, miscalibrated for higher dimensional aspects, or even only one, might be detected by others as miscalibrated for specific reasons, if effects that were deliberately miscalibrated or deliberately 'defective' in terms of life support provided, for example, were used by policy, such as when there was suspected criminal presence.

So one instance of 'miasma' life support, which has effects that extend and surround people or things like a ghostly hand, that encountered something or someone in a universe other than what it expected, so the effects would be miscalibrated in higher dimensional aspects, would be generating those miscalibrated effects, and because miasma life support operates like a balloon being blown up inside another balloon, and the effects naturally follow other similar effects to the same people and things, other instances of effects like that would encounter the miscalibrated effects, and if miscalibrated effects were used by policy to indicate things related to suspicion or guilt or danger, those following effects would be likely to misinterpret the unintentional miscalibration as proof of criminal guilt or enemy status.
